INTRODUCTION

Thank you for purchasing this model of the standby generator set.

Every effort was expended to make sure that the information and instructions in this manual are both accurate and current at the time the manual was written. However, the manufacturer reserves the right to change, alter or otherwise improve this product(s) at any time without prior notice.

READ THIS MANUAL THOROUGHLY

If any portion of this manual is not understood, contact the nearest Dealer for starting, operating and servicing procedures.

Throughout this publication, and on tags and decals affixed to the generator, DANGER, WARNING, CAUTION and NOTE blocks are used to alert personnel to special instructions about a particular service or operation that may be hazardous if performed incorrectly or carelessly. Observe them carefully. Their definitions are as follows:

▲ DANGER!

INDICATES A HAZARDOUS SITUATION OR ACTION WHICH, IF NOT AVOIDED, WILL RESULT IN DEATH OR SERIOUS INJURY.

AWARNING!

Indicates a hazardous situation or action which, if not avoided, could result in death or serious injury.

ACAUTION!

Indicates a hazardous situation or action which, if not avoided, could result in minor or moderate injury.

NOTE:

Notes contain additional information important to a procedure and will be found within the regular text body of this manual.

These safety warnings cannot eliminate the hazards that they indicate. Common sense and strict compliance with the special instructions while performing the action or service are essential to preventing accidents.

Four commonly used safety symbols accompany the **DANGER**, WARNING and CAUTION blocks. The type of information each indicates is as follows:

This symbol points out important safety information that, If not followed, could endanger personal safety and/or property of others.

This symbol points out potential explosion hazard.

This symbol points out potential fire hazard.

This symbol points out potential electrical shock hazard.

HOW TO OBTAIN SERVICE

When the generator requires servicing or repairs, contact a Dealer for assistance. Service technicians are factory-trained and are capable of handling all service needs.

When contacting a Dealer about parts and service, always supply the complete Model number, Serial number and Type Code (where applicable), of the unit as given on the Data Label affixed to the unit.

CALIFORNIA PROPOSITION 65 WARNING

Engine exhaust and some of its constituents are known to the State of California to cause cancer, birth defects and other reproductive harm.

CALIFORNIA PROPOSITION 65 WARNING

This product contains or emits chemicals known to the State of California to cause cancer, birth defects and other reproductive harm.

Save These Instructions – The manufacturer suggests that these rules for safe operation be copied and posted in potential hazard areas. Safety should be stressed to all operators, potential operators, and service and repair technicians for this equipment.

Save These Instructions – This manual contains important instructions that should be followed during installation of the generator and batteries.

Study these SAFETY RULES carefully before installing, operating or servicing this equipment. Become familiar with this *Owner's Manual* and with the unit. The generator can operate safely, efficiently and reliably only if it is properly installed, operated and maintained. Many accidents are caused by failing to follow simple and fundamental rules or precautions.

The manufacturer cannot anticipate every possible circumstance that might involve a hazard. The warnings in this manual, and on tags and decals affixed to the unit are, therefore, not all inclusive. If using a procedure, work method or operating technique that the manufacturer does not specifically recommend, ensure that it is safe for others. Also make sure the procedure, work method or operating technique utilized does not render the generator unsafe.

▲ DANGER!

Despite the safe design of this generator, operating this equipment imprudently, neglecting its maintenance or being careless can cause possible injury or death. Permit only responsible and capable persons to install, operate or maintain this equipment.

Potentially lethal voltages are generated by these machines. Ensure all steps are taken to render the machine safe before attempting to work on the generator.

Parts of the generator are rotating and/or hot during operation. Exercise care near running generators.

Generator exhaust gases contain DEADLY carbon monoxide gas. This dangerous gas, if breathed, can cause headaches, fatigue, dizziness, vomiting, confusion, seizures, nausea, fainting, unconsciousness or even death. Operate this equipment only in the open air where adequate ventilation is available.

GENERAL HAZARDS

- For safety reasons, the manufacturer recommends that this equipment be installed, serviced and repaired by an authorized dealer or other competent, qualified electrician or installation technician who is familiar with applicable codes, standards and regulations. The operator also must comply with all such codes, standards and regulations.
- Installation, operation, servicing and repair of this (and related) equipment must always comply with applicable codes, standards, laws and regulations. Adhere strictly to local, state and national electrical and building codes. Comply with regulations the Occupational Safety and Health Administration (OSHA) has established. Also, ensure that the generator is installed, operated and serviced in accordance with the manufacturer's instructions and recommendations. Following installation, do nothing that might render the unit unsafe or in noncompliance with the aforementioned codes, standards, laws and regulations.
- Keep hands, feet, clothing, etc., away from drive belts, fans, and other moving or hot parts. Never remove any drive belt or fan guard while the unit is operating.
- When working on this equipment, remain alert at all times. Never work on the equipment when physically or mentally fatigued.
- Inspect the generator regularly, and promptly repair or replace all worn, damaged or defective parts using only factoryapproved parts.
- Before performing any maintenance on the generator, disconnect its battery cables to prevent accidental start-up. Disconnect the cable from the battery post indicated by a NEGATIVE, NEG or (–) first. Reconnect that cable last.
- Never use the generator or any of its parts as a step. Stepping on the unit can stress and break parts, and may result in dangerous operating conditions from leaking exhaust gases, fuel leakage, oil leakage, etc.

ELECTRICAL HAZARDS

- All generators covered by this manual produce dangerous electrical voltages and can cause fatal electrical shock. Utility power delivers extremely high and dangerous voltages to the transfer switch as well as the standby generator. Avoid contact with bare wires, terminals, connections, etc., on the generator as well as the transfer switch, if applicable. Ensure all appropriate covers, guards and barriers are in place before operating the generator. If work must be done around an operating unit, stand on an insulated, dry surface to reduce shock hazard.
- Do not handle any kind of electrical device while standing in water, while barefoot, or while hands or feet are wet. **DANGEROUS ELECTRICAL SHOCK MAY RESULT.**

- If people must stand on metal or concrete while installing, operating, servicing, adjusting or repairing this equipment, place insulative mats over a dry wooden platform. Work on the equipment only while standing on such insulative mats.
- The National Electrical Code (NEC), Article 250 requires the frame and external electrically conductive parts of the generator to be connected to an approved earth ground and/or grounding rods. This grounding will help prevent dangerous electrical shock that might be caused by a ground fault condition in the generator set or by static electricity. Never disconnect the ground wire.
- Wire gauge sizes of electrical wiring, cables and cord sets must be adequate to handle the maximum electrical current (ampacity) to which they will be subjected.
- Before installing or servicing this (and related) equipment, make sure that all power voltage supplies are positively turned off at their source. Failure to do so will result in hazardous and possibly fatal electrical shock.
- Connecting this unit to an electrical system normally supplied by an electric utility shall be by means of a transfer switch so as to isolate the generator electric system from the electric utility distribution system when the generator is operating. Failure to isolate the two electric system power sources from each other by such means will result in damage to the generator and may also result in injury or death to utility power workers due to backfeed of electrical energy.
- Generators installed with an automatic transfer switch will crank and start automatically when normal (utility) source voltage is removed or is below an acceptable preset level. To prevent such automatic start-up and possible injury to personnel, disable the generator's automatic start circuit (battery cables, etc.) before working on or around the unit. Then, place a "Do Not Operate" tag on the generator control panel and on the transfer switch.
- In case of accident caused by electric shock, immediately shut down the source of electrical power. If this is not possible, attempt to free the victim from the live conductor. AVOID DIRECT CONTACT WITH THE VICTIM. Use a nonconducting implement, such as a dry rope or board, to free the victim from the live conductor. If the victim is unconscious, apply first aid and get immediate medical help.
- Never wear jewelry when working on this equipment. Jewelry can conduct electricity resulting in electric shock, or may get caught in moving components causing injury.

FIRE HAZARDS

 Keep a fire extinguisher near the generator at all times. Do NOT use any carbon tetra-chloride type extinguisher. Its fumes are toxic, and the liquid can deteriorate wiring insulation. Keep the extinguisher properly charged and be familiar with its use. If there are any questions pertaining to fire extinguishers, consult the local fire department.

EXPLOSION HAZARDS

- Do not smoke around the generator. Wipe up any fuel or oil spills immediately. Ensure that no combustible materials are left in the generator compartment, or on or near the generator, as FIRE or EXPLOSION may result. Keep the area surrounding the generator clean and free from debris.
- This generator may operate using one of several types of fuels. All fuel types are potentially FLAMMABLE and/or EXPLOSIVE and should be handled with care. Comply with all laws regulating the storage and handling of fuels. Inspect the unit's fuel system frequently and correct any leaks immediately. Fuel supply lines must be properly installed, purged and leak tested according to applicable fuel-gas codes before placing this equipment into service.
- Gaseous fluids such as natural gas and liquid propane (LP) gas are extremely EXPLOSIVE. Natural gas is lighter than air, and LP gas is heavier than air; install leak detectors accordingly.

LOCATION/EXHAUST HAZARDS

- The engine exhaust fumes contain carbon monoxide gas, which can be DEADLY. This dangerous gas, if breathed in sufficient concentrations, can cause unconsciousness or even death. For that reason, adequate ventilation must be provided. This should be considered prior to installing the generator. The unit should be positioned to direct exhaust gasses safely away from any building where people, animals, etc., will not be harmed. Any exhaust stacks that ship loose with the unit must be installed properly per the manufacturer's instruction, and in strict compliance with applicable codes and standards.
- Adequate, unobstructed flow of cooling and ventilating air is critical to prevent buildup of explosive gases and to ensure correct generator operation. Do not alter the installation or permit even partial blockage of ventilation provisions, as this can seriously affect safe operation of the generator.
- Keep the area around the generator clean and uncluttered. Remove any materials that could become hazardous.

1.1 GENERATOR INSTALLATION

This equipment is a liquid-cooled, engine-driven generator set. The generator is designed to supply electrical power that operates critical electrical loads during utility power failure. The unit has been factory-installed in a weather resistant, all metal enclosure and is intended for outdoor installation only.

AWARNING!

If this generator is used to power electrical load circuits normally powered by a utility power source, it is required by code to install a transfer switch. The transfer switch must effectively isolate the electric system from the utility distribution system when the generator is operating (NEC 701). Failure to isolate an electrical system by such means results in damage to the generator and may also result in injury or even death to utility power workers due to backfeed of electrical energy.

1.2 BEFORE INSTALLATION NOTE:

Contact the local inspector or City Hall to make sure you are aware of all federal, state and local codes that could impact the installation. Secure all required permits before starting the job.

Before installing this equipment, check the ratings of both the generator and the transfer switch. Read "Emergency Isolation Method" and "Total Circuit Isolation Method".

The generator's rated wattage/amperage capacity must be adequate to handle all electrical loads that the unit will power. The critical (essential) loads may need to be grouped together and wired into a separate "emergency" distribution panel.

▲ DANGER!

Connecting this generator to an electrical system normally supplied by an electric utility shall be by means of a transfer switch, so as to isolate the electric system from the utility distribution system when the generator is operating. Failure to isolate the electric system by these means will result in damage to the generator and may also result in injury or death to utility workers due to backfeed of electrical energy.

If an open bottom is used, the engine-generator is to be installed over non-combustible materials and should be located such that combustible materials are not capable of accumulating under the generator set.

Only authorized dealers or qualified, competent installation contractors or electricians thoroughly familiar with applicable codes, standards and regulations should install this standby electric power system. The installation must comply strictly with all codes, standards and regulations pertaining to the installation.

▲ CAUTION!

After the system has been installed, do nothing that might render the installation in noncompliance with such codes, standards and regulations.

<u>1.2.1 NFPA STANDARDS</u>

The following published standards booklets pertaining to standby electric systems are available form the National Fire Protection Association (NFPA), Batterymarch Park, Quincy, MA 02269:

- NFPA No. 37, STATIONARY COMBUSTION ENGINES AND GAS TURBINES
- NFPA No. 54, NATIONAL FUEL GAS CODE
- NFPA No. 58, LIQUEFIED PETROLEUM GAS CODE
- NFPA 70, NATIONAL ELECTRIC CODE (NEC)
- NFPA 99, STANDARD FOR HEALTH CARE FACILITIES
- NFPA 101, LIFE SAFETY CODE
- NFPA 110, STANDARD FOR EMERGENCY AND STANDBY POWER SYSTEMS
- NFPA 220, STANDARD TYPES OF BUILDING CONSTRUCTION
 NOTE:

It is essential to use the latest version of any standard to ensure that the generator and its accessories comply with all the applicable standards and local codes.

1.2.2 OTHER PUBLISHED STANDARDS

In addition to NFPA standards, the following information pertaining to the installation and use of standby electric systems is available:

- Article X, NATIONAL BUILDING CODE, available from the American Insurance Association, 85 John Street, New York, N.Y. 10038.
- AGRICULTURAL WIRING HANDBOOK, obtainable from the Food and Energy Council, 909 University Avenue, Columbia, MO, 65201.
- ASAE EP-364.2, INSTALLATION AND MAINTENANCE OF FARM STANDBY ELECTRIC POWER, available from the American Society of Agricultural Engineers, 2950 Niles Road, St. Joseph, MI 49085.
- A52.1, AMERICAN NATIONAL STANDARD FOR CHIMNEYS, FIREPLACES AND VENTING SYSTEMS, available from the American National Standard Institute, 1430 Broadway, New York, N.Y. 10018.

NOTE:

It is essential to use the latest version of any standard to ensure that the generator and its accessories comply with all the applicable standards and local codes.

The installer must comply with all applicable state and local codes.

1.3 GENERATOR LOCATION

Install the generator set, in its protective enclosure outdoors, where adequate cooling and ventilating air always is available. Consider these factors:

- Install the unit where air inlet and outlet openings will not become obstructed by leaves, grass, snow, etc. If prevailing winds will cause blowing or drifting, consider using a windbreak to protect the unit.
- Install the generator on high ground where water levels will not rise and endanger it.
- This genset must be installed on a level surface. The base frame must be level within 1/2 inch all around.
- Allow sufficient room on all sides of the generator for maintenance and servicing. This unit must be installed in accordance with current applicable NFPA 37 and NFPA 70 standards, as well as any other federal, state and local codes for minimum distances from other structures.
- Where strong prevailing winds blow from one direction, face the generator air inlet openings into the prevailing winds.
- Install the generator as close as possible to the transfer switch. This reduces the length of wiring and conduit.
- Install the generator as close as possible to the fuel supply, to reduce the length of piping. HOWEVER, REMEMBER THAT LAWS OR CODES MAY REGULATE THE DISTANCE.

1.4 GENERATOR MOUNTING AND SUPPORT

When designing a concrete base slab, all federal, state and local codes should be followed. Special attention should be given to the concrete base slab which should exceed the length and width of the generator by a minimum of 6 inches on all sides.

The mounting pad should be located as close as possible to the transfer switch and fuel supply. Make sure you leave adequate room around the generator for service access. Five feet is a good rule of thumb, but local codes vary.

Place the pad high enough to keep rising water from reaching the generator. Make sure the generator will have adequate and unobstructed airflow by choosing an open space free of trees, shrubs, buildings or other obstructions (Figure 1.1).

Figure 1.1 — Mounting Pad

The unit must be positioned so air vents won't become clogged with leaves, grass, snow or debris. Make sure that exhaust fumes will not enter the building through eaves, windows, ventilation fans or other air intakes.

Position the electrical conduit for power wiring, control wiring and the battery charger circuit so the generator can be placed correctly on the pad (Figure 1.2). Refer to the installation diagram supplied with the owners manual for the correct stub up area location.

The concrete pad should be reinforced and deep enough so that the weight of the pad is equal to the weight of the generator (refer to the "Generator Mounting and Support" section in this manual).

The length and width of the pad should exceed the length and width of the generator by at least 6 inches on all sides and the pad must be level within $\frac{1}{2}$ inch all around.

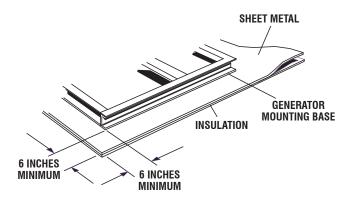

1.4.1 COMBUSTIBLE FLOOR AND ROOF PROTECTION

If the generator must be installed on any combustible floor or roof, comply with the following rules:

- Place a layer of non-combustible insulation, followed by a layer of sheet metal beneath the unit's mounting base rails (Figure 1.3).
- Both the layer of insulation and the sheet metal must extend beyond the generator base to a distance of at least 6 inches (15.24 cm) on all sides.

For rooftop or building structure mounting, it is recommended that spring isolators be installed between the engine frame and the mounting system. A minimum of six (6) isolators are required and must be located at the front and rear cross members and the center of the frame.

Figure 1.3 — Combustible Floor and Roof Protection

Since the entire bottom of the genset is now exposed, it should be covered with a metal plate to keep out small animals and protect the integrity of the internal parts of the genset. Genset movement is more intense with spring isolation, so flexible connections for the fuel and the electrical conduits are also required.

NOTE:

Consult the local building codes which may vary.

1.5 UNPACKING

1.5.1 UNPACKING PRECAUTIONS

Handle shipping cartons and crates with care. Use care to avoid damage from dropping, bumping, collision, etc. Store and unpack cartons with the proper side up, as noted on the shipping carton.

1.5.2 INSPECTION

After unpacking, carefully inspect the generator for any damage that may have occurred during shipment. If loss or damage is noted at the time of delivery, have the person(s) making delivery note all damage on the freight bill or affix their signature under the consignor's memo of loss or damage.

1.6 LIFTING THE GENERATOR

When lifting or hoisting equipment is used, be careful not to touch overhead power lines. Generators that weigh more than 900 pounds require proper tools, equipment, and qualified personnel to be used in all phases of handling and unpacking.

1.7 GENERATOR PLACEMENT

Use a forklift, boom truck or similar equipment with sufficient capacity to move the generator to the mounting pad area. The operator should be certified and experienced in generator installation (Figure 1.4).

Figure 1.4 — Lifting the Generator

Before placing the generator on the pad, inspect for shipping damage and if necessary, file a claim with the shipper.

After removing the bolts holding the generator base frame to the wooden pallet, use the lifting eyes on the base frame to lift the generator onto the pad.

When properly positioned, secure the base frame to the pad with appropriately sized masonry bolts.

Connect an approved ground strap to the grounding lug on the base frame and to an earth ground or grounding rod consistent with local regulations (Figure 1.5).

Figure 1.5 — Connect Ground Wire

General Information

1.8 FUEL SYSTEMS

<u>1.8.1 FUEL CONVERSION</u>

The generator shipped from the manufacturer configured to run on natural gas. Refer to the Owner's Manual for details on converting the generator to run on LP vapor.

<u>1.8.2 INTRODUCTION TO GASEOUS FUEL SYSTEMS</u> **A DANGER!**

Gaseous fuels, such as LP and natural gas, are highly volatile and their vapors are explosive. LP gas is heavier than air and will settle in low areas. Natural gas is lighter than air and will settle in high areas. Even the slightest spark can ignite these fuels and cause an explosion. For safety, all codes, standards and regulations pertaining to the installation and use of gaseous fuels must be strictly complied with.

Local fuel gas codes may vary widely. For that reason, it is recommended that a local gas distributor or installer be consulted when installing a gaseous fuel supply system.

In the absence of local fuel gas codes and regulations, booklets published by the National Fire Protection Association (NFPA) may be used as sources of information.

Gaseous fuel systems should be installed by a licensed plumber who is experienced in generator installation and is familiar with local codes and regulations.

When installing rigid natural gas lines, always use AGA approved black pipe.

In most applications, a manual shutoff valve and a primary regulator must be a part of the installation (Figure 1.7).

Figure 1.7 — Manual Shutoff Valve

A section of UL or AGA approved flexible fuel line is required to protect the rigid fuel line connections against vibration from the generator.

Installing the flexible fuel line with as few bends as possible will allow the flexible section to absorb and mitigate vibration. Never use a flexible fuel line to avoid an elbow in a rigid line and never attach gaseous fuel line supports to any part of the generator. Doing so defeats the purpose of the flexible fuel line (Figure 1.8).

After checking all connections for leaks, check the static gas pressure at the secondary regulator to ensure there is sufficient pressure to operate the generator (see Owner's Manual).

If the static pressure is too low, or is higher than 14 inches of water column, notify the local gas supplier. (Figure 1.9)

Figure 1.9 — Water Column

1.8.3 PROPERTIES OF GASEOUS FUELS

Natural Gas

Natural gas is lighter than air. It is found in the gaseous state at normal ambient temperatures and pressures. It is highly explosive and can be ignited at the slightest spark. For that reason, fuel lines must be free of leaks and adequate ventilation is absolutely essential.

Local fuel/gas codes usually dictate the maximum pressure at which natural gas can enter a structure. In order to reduce the gas pressure to that required by law, a PRIMARY REGULATOR is required.

LP Gas

Liquefied petroleum (LP) gas is heavier than air. The gas vapors are explosive and, like natural gas, can be ignited by the slightest spark.

LP tank pressure is dependent on the ambient temperature and can be as high as 200 psi. A primary regulator is required at the tank to reduce the pressure to the required five to 14 inches of water column for units less than 70kW, or 11 to 14 inches of water column for units 70kW and larger.

1.8.4 THE NATURAL GAS SYSTEM

A typical natural gas system is shown in Figure 1.10. The maximum pressure at which the gas can enter a building is established by code and may vary from area to area. A primary regulator is required to reduce gas supply pressures to the required safe level before the gas enters a structure.

The primary regulator may or may not be provided by the gas supplier. The gas distribution company will usually provide piping from the main distribution line to the generator site. It is the responsibility of the gas supplier to ensure that sufficient gas pressure is available to operate the primary regulator.

From the primary regulator, gas flows to the generator connection. A flexible length of gas line is required between rigid piping and the gas connection at the generator. The generator fuel system consists of an electrical fuel shutoff valve/regulator assembly and a gas actuator.

The secondary regulator reduces gas pressure to about five inches of water column before the gas Is delivered to the actuator.

NOTE:

Gas pressure from the primary regulator (supplied by the installing contractor) to the generator's fuel shutoff valve should not exceed 14 inches of water column.

Follow the local codes on selecting the required AGA approved, and UL listed, for NG application flexible portion of the fuel line (supplied by the installing contractor).

1.8.5 LP GAS VAPOR WITHDRAWAL SYSTEM

This type of system utilizes the vapors formed above the liquid fuel in the supply tank (see Figure 1.11). Approximately 10 to 20 percent of the tank capacity is needed for fuel expansion from the liquid to the vapor state. Gas pressure requirements for an LP vapor system at the frame of the generator are the same as those listed for natural gas in "The Natural Gas System". See Table 1 for information regarding the vapor capacity of LP tanks. The installer should be aware of the following:

- When ambient temperatures are low and engine fuel consumption is high, the vapor withdrawal system may not function efficiently.
- Ambient temperatures around the supply tank must be high enough to sustain adequate vaporization or the system will not deliver the needed fuel volume.
- In addition to the cooling effects of ambient air, the vaporization process itself provides an additional cooling effect.

1.8.6 GASEOUS FUEL SYSTEM PIPING

NOTE:

The information below is to assist in planning gaseous fuel installation. In NO WAY should this information be interpreted to conflict with applicable fuel gas codes. Contact the local jurisdiction if questions arise.

The following general rules apply to piping used in gaseous fuel systems:

- The piping should be of black iron, rigidly mounted and protected against vibration.
- Install the supplied length of flexible hose between the generator connection point and rigid piping.

▲ CAUTION!

The supplied flexible hose is not to be installed underground or in contact with ground. The flexible hose is for in-line installation only. Bends, kinks or off-center in-line installation of flexible hose is NOT allowed.

- Piping must be of the correct size to maintain the required supply pressures and volume flow under varying conditions (see Calculating volumetric Flow Rate and Pipe Size).
- Installed piping must be properly purged and leak-tested, in accordance with applicable codes and standards.
- Use an approved pipe sealant or joint compound on all threaded fittings, to reduce the possibility of leakage.

NOTE:

In the absence of local purging and leak test standards, NFPA No. 54 may be used as a guide.

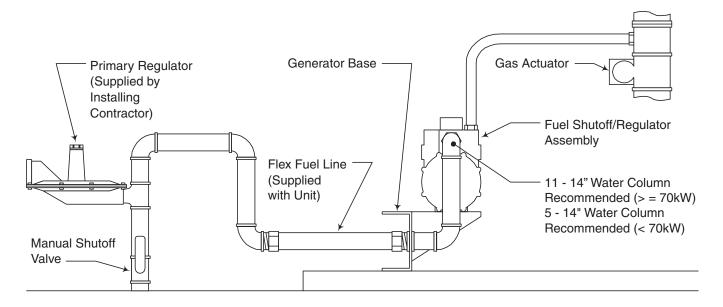

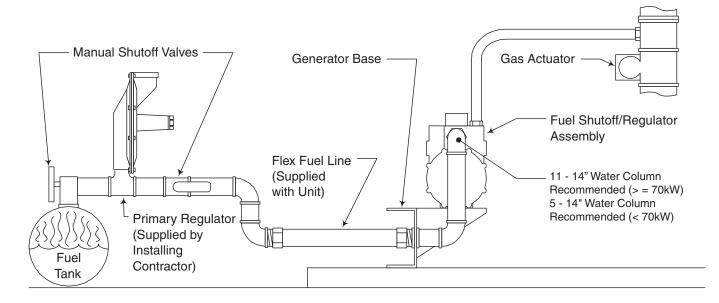

Figure 1.11 — Typical LP Gas Vapor Withdrawal System

1.9 CALCULATING VOLUMETRIC FLOW RATE AND PIPE SIZE

If the Owner's Manual identifies the fuel consumption requirements by a volumetric flow rate (units of ft³/hr), skip the next section and go on to the section, Calculating Pipe Size. If the Fuel Consumption requirements are given in units of lb/hr, follow the next section, Calculating Volumetric Flow Rate.

1.9.1 CALCULATING VOLUMETRIC FLOW RATE

Since the fuel consumption requirements (from the owners manual) are given as a mass flow (units of lb/hr), the volumetric flow rate (ft³/hr) must be identified before the appropriate pipe size can be selected. The relationship between the mass flow rate (lb/hr), density (lb/ft3), and volumetric flow rate (ft3/hr) can be described by Equation 1. According to Equation 1, the volumetric flow rate can be calculated by dividing the mass flow rate by the density. You may need to contact your fuel vendor to identify the density or specific gravity for your fuel. If your vendor provides the specific gravity (relative to air) Table 1 can be used to identify the appropriate density. Since the density of natural gas and LP is temperature dependant, the maximum temperature of the fuel (at the fuel shutoff/regulator assembly) should be measured so the fuel consumption requirements can be more accurately identified for the generator. A sample calculation (Example 1) is included in this section.

Equation 1:

$$\dot{\nu} = \frac{\dot{m}}{D}$$

Where:

 $\dot{\nu}$ = Volumetric Flow Rate (ft³/hr)

 $\dot{m} = Mass Flow Rate (lb/hr)$

 ρ = Density from Table 1 - $\frac{(T-60)}{C}$

C = 11111 (for Natural Gas) or 3333 (for LP)

T = Temperature of the fuel into the fuel shut-off/regulator

Example 1: Determine the volumetric flow rate for a generator that requires 91.34 lb/hr of natural gas at 100% load.

Solution:

Specific gravity according to the local vendor: 0.5

Density of Natural Gas from Table 1: 0.0383 lb/ft³

Maximum Temperature of the fuel going into the generator: 90°F

C=11111 (for Natural Gas) from Equation 1

$$\dot{\nu} = \frac{\dot{m}}{\rho}$$
 and $p = 0.0383 - \frac{(90-60)}{1111}$
 $p = 0.0356 \text{ lb/ft}^3$

Thus:

$$\dot{\nu} = \frac{91.34}{0.0356}$$

And:

 $\dot{\nu}$ = 2566 ft³/hr

1.9.2 CALCULATING PIPE SIZE

Now that the volumetric flow rate has been identified, the minimum pipe size can be determined by using Table 2. This table is based on a specific gravity of 1.00 (specific gravity of air). For that reason, a correction is required when the fuel used has a different specific gravity. The fuel's specific gravity can be obtained from the fuel supplier. The table is also based on a pressure drop of 0.3, which allows for a nominal amount of restrictions from bends, fittings, etc. Example 2 illustrates how to calculate the pipe size for the generator.

Example 2: Determine the iron pipe size for a generator that requires 2566 ft³/hr of Natural Gas. The unit is located 75 feet from the fuel source.

Solution:

Specific gravity of natural gas according to the local vendor: 0.5

Multiplier for the given specific gravity from Table 1: 1.1

According to Table 2, a 2-1/2 inch pipe will deliver 1750 ft 3 /hr of air if it is located 75 feet from the fuel source. To determine the volumetric flow rate of natural gas, multiply the given flow rate by the multiplier (from Table 1).

| Natural gas flow rate | = air flow rate (ft ³ /hr) * Multiplier |
|-----------------------|--|
| | = 1750 ft ³ /hr * 1.10 |
| Natural gas flow rate | = 1925 ft ³ /hr |
| O' | under a 0 d /0 imple implementation in lange theme |

Since the flow rate through a 2-1/2 inch iron pipe is less than the flow rate required by the generator (2430 ft³/hr), we must evaluate the next larger pipe (3 inches) by the same method.

| Natural gas flow rate | = air flow rate (ft ³ /hr) * Multiplier |
|-----------------------|--|
| | = 3000 ft ³ /hr * 1.10 |
| Natural gas flow rate | = 3300 ft ³ /hr |

A 3 inch pipe is required at the given distance of 75 feet. Pressure drop does not have to be considered unless an unusual number of fittings, bends or other restrictions are used. In such unusual cases, the fuel supplier will usually specify which multiplier is applicable.

NOTE:

The installed piping system shall be capable of providing the Fuel Consumption requirements as identified in the specifications section of the Owners Manual.

TABLE 1

| Specific Gravity(1) | Multiplier | Density lb/ft ³ | Specific Gravity(1) | Multiplier | Density lb/ft ³ | Pressure Drop | Multiplier | |

| 600 | | | | 119 | 192 | 390 | 600 | 1030 | 2130 | 6000 | 12480 |

TABLE 3 — VAPOR CAPACITY OF PROPANE STORAGE TANKS

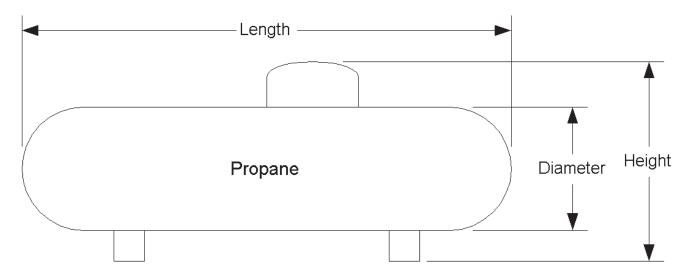

To Use: Go to the First column and pick the required kW load and then pick the minimum ambient temperature (40°, 20° or 0° F) that the generator would be operating in. The third column (tank capacity) will give the required tank size to continually produce the given fuel flow.

| Max kW Vapor | Minimum Temp | Operating Hours @ Max kW | Tank Capacity (Gallons) | Length Inches | Dia Inches | Overall Ht. Inches |
|-----------------|-----------------|--------------------------------|----------------------------|------------------|---------------|-----------------------|
| 30 | 40 | 24 | | | | |
| 20 | 20 | 35 | 120 | 57 | 24 | 33 |
| 10 | 0 | 67 | | | | |
| 35 | 40 | 26 | | | | |
| 25 | 20 | 36 | 150 | 68 | 24 | 33 |
| 12 | 0 | 72 | | | | |
| 60 | 40 | 26 | | | | |
| 40 | 20 | 38 | 250 | 94 | 30 | 39 |
| 20 | 0 | 74 | | | | |
| 80 | 40 | 26 | | | | |
| 50 | 20 | 40 | 325 | 119 | 30 | 39 |
| 25 | 0 | 77 | | | | |
| 100 | 40 | 31 | | | | |
| 60 | 20 | 51 | 500 | 119 | 37 | 46 |
| 30 | 0 | 100 | | | | |
| 150 | 40 | 35 | | | | |
| 100 | 20 | 53 | 850 | 165 | 41 | 50 |
| 50 | 0 | 105 | | | | |
| 170 | 40 | 36 | | | | |
| 120 | 20 | 51 | 1000 | 192 | 41 | 50 |
| 60 | 0 | 103 | | | | |

Propane storage tanks can provide either a liquid or a vapor supply to the generator. The above chart is for **vapor withdrawal only** and provides the kW output or amount of vapor that can be withdrawn at a given temperature while keeping the temperature of the liquid above the boiling point. If the withdrawal rate is too high, the LP temperature goes below the boiling point, the pressure drops to zero and no vapor can be withdrawn. A primary regulator is also required at the tank to reduce the line pressure to the generator to 5-14 inches of water column.

Propane Conversions: $36.38 \text{ ft}^3 = 90,500 \text{ btu} = 1 \text{ gal} \bullet 11\text{b} = 21,500 \text{ btu} = 8.56 \text{ ft}^3$

Propane Storage Tank

1.10 ELECTRICAL CONNECTIONS

1.10.1 GROUNDING THE GENERATOR

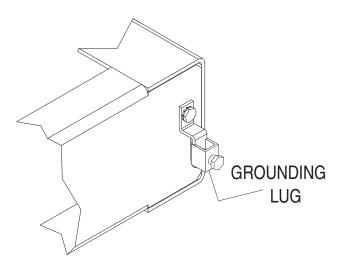

A GROUNDING LUG is provided on the generator mounting base for the purpose of grounding the frame and the external electrically conductive parts of this equipment to an approved earth ground and/or grounding rods where required by the National Electrical Code (Figure 1.12). Consult a qualified electrician for grounding requirements in the area. Grounding procedures must meet local regulations.

▲ DANGER!

Do not connect the ground wire to any pipe that Carries a flammable or explosive substance – FIRE or an EXPLOSION may result.

Proper grounding helps protect personnel against electrical shock in the event of a ground fault condition in the generator or in connected electrical devices. In addition, grounding helps dissipate static electricity that often builds up in ungrounded devices.

Figure 1.12 – Generator Grounding Lug (typical)

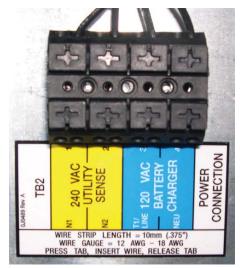

1.10.2 BATTERY CHARGER CONNECTION

The generator has been equipped with a battery charger integrated in the control panel. Power leads for the charger have been run to the connection box (Figure 1.13). Connect the power leads for the battery charger to the 120 VAC (T1/LINE) connection and the neutral lead to the NEU connection. This is a 15 amp circuit supplied by the customer.

(Refer to the wiring diagram in the Owner's Manual that is supplied with the unit.)

Figure 1.13 — Battery Charger Connection

1.11 BATTERY INSTALLATION ▲ DANGER!

Standby generators installed with automatic transfer switches will crank and start automatically when NORMAL (UTILITY) source voltage is removed or is below an acceptable preset level. To prevent such automatic start-up and possible injury to personnel, do not connect battery cables until certain that normal source voltage at the transfer switch is correct and the system is ready to be placed into operation.

Storage batteries give off explosive hydrogen agas. This gas can form an explosive mixture around the battery for several hours after charging. The slightest spark can ignite the gas and cause an explosion. Such an explosion can shatter the battery and cause blindness or other injury. Any area that houses a storage battery must be properly ventilated. Do not allow smoking, open flame, sparks or any spark producing tools or equipment near the battery.

Battery electrolyte fluid is an extremely caustic sulfuric acid solution that can cause severe burns. Do not permit fluid to contact eyes, skin, clothing, painted surfaces, etc. Wear protective goggles, protective clothing and gloves when handling a battery. If fluid is spilled, flush the affected area immediately with clear water.

A WARNING!

Do not dispose of the battery in a fire. The battery is capable of exploding.

Do not open or mutilate the battery. Released electrolyte can be toxic and harmful to the skin and eves.

The battery represents a risk of high short circuit current. When working on the battery, always remove watches, rings or other metal objects, and only use tools that have insulated handles.

1.11.1 VENTED BATTERIES

▲ CAUTION!

The electrolyte is a dilute sulfuric acid that is harmful to the skin and eyes. It is electrically conductive and corrosive. The following procedures are to be observed:

- · Wear full eye protection and protective clothing,
- Where electrolyte contacts the skin, wash it off immediately with water,
- Where electrolyte contacts the eyes, flush thoroughly and immediately with water and seek medical attention, and
- Spilled electrolyte is to be washed down with an acidneutralizing agent. A common practice is to use a solution of one pound (500 grams) bicarbonate of soda to one gallon (4 liters) of water. The bicarbonate of soda solution is to be added until the evidence of reaction (foaming) has ceased. The resulting liquid is to be flushed with water and the area dried.

Lead acid batteries present a risk of fire because they generate hydrogen gas. The following procedure are to be followed:

- · DO NOT SMOKE when near batteries,
- DO NOT cause flame or spark in battery area, and
- Discharge static electricity from body before touching batteries by first touching a grounded metal surface.

Servicing of batteries is to be performed or supervised by personnel knowledgeable of batteries and the required precautions. Keep unauthorized personnel away from batteries.

For recommended batteries, see the "Specifications" section in the Owner's Manual. All batteries must be at 100 percent state-of-charge before they are installed on the generator.

When using maintenance-free batteries, it is not necessary to check the specific gravity or electrolyte level. Have these procedures performed at the intervals specified in the "Maintenance" section in the Owner's Manual. A negative ground system is used. Battery connections are shown on the wiring diagrams. Make sure all batteries are correctly connected and terminals are tight. Observe battery polarity when connecting batteries to the generator set.

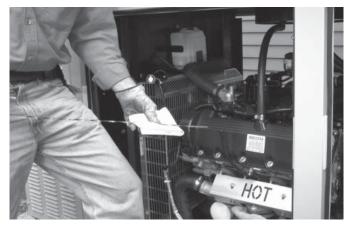

NOTE:

Damage will result if the battery connections are made in reverse.

Before connecting the battery, make certain that normal utility voltage at the transfer switch is correct and the system is ready to be put into operation.

Check the engine oil, the coolant level, belt tension, and if so equipped, the gearbox oil (Figure 1.14).

Figure 1.14 — Check Engine Oil

Check the battery to make sure it is fully charged before installing.

Follow all safety procedures detailed in the Owner's Manual and observe polarity when connecting the battery. Make sure all terminal connections are tight (Figure 1.15).

Figure 1.15 — Check Terminal Connections

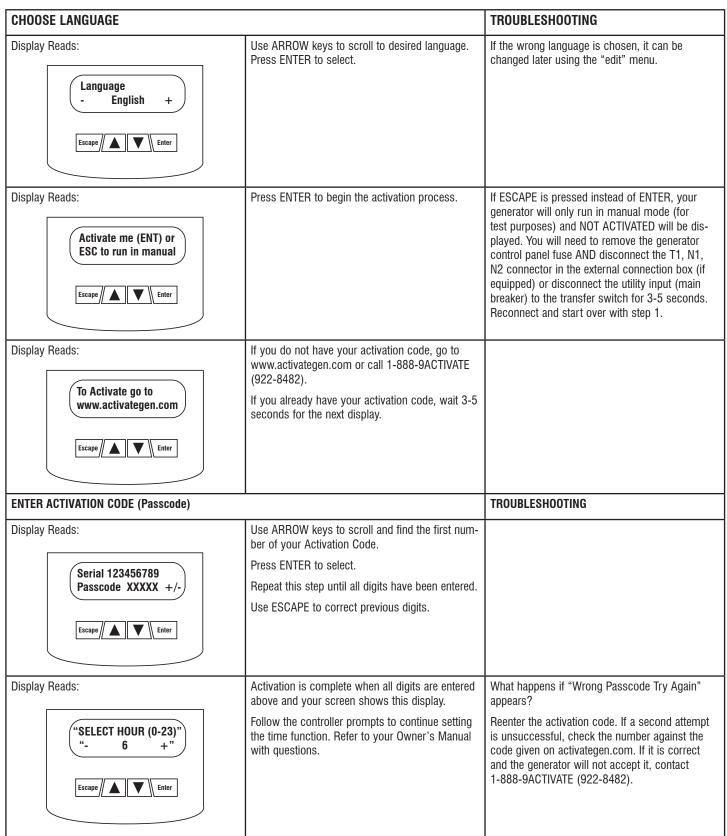

1.12 GENERATOR ACTIVATION

When battery power is applied to the generator during the installation process, the controller will light up. However, the generator still needs to be activated before it will automatically run in the event of a power outage.

Activating the generator is a simple one time process that is guided by the controller screen prompts. Once the product is activated, the controller screen will not prompt you again, even if you disconnect the generator battery.

After obtaining your activation code, please complete the following steps at the generator's control panel in the **Activation Chart** (shown on the following page).
